

# New Hampshire Population Growth and the Proliferation of Exotic Aquatic Plants

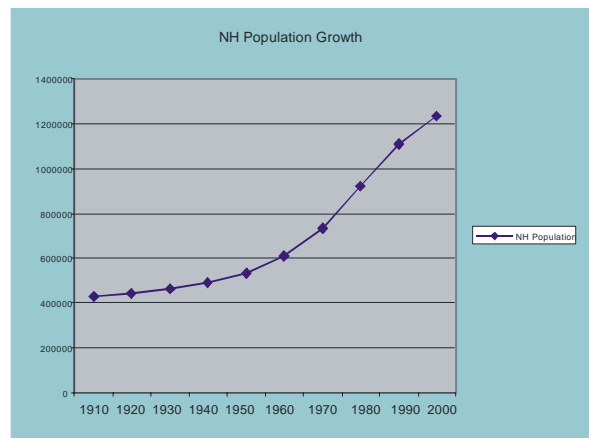

Created in: *Geography 324: ArcView GIS*

Exotic aquatic invasive plant species are "environmental cancers" which, once established quickly outcompete and eliminate native species. As the human population of New Hampshire has grown dramatically over the last 50 years, these aquatic invaders have spread rapidly. Shown here is the relationship between the growth of New Hampshire's human population and the spread of invasive species over time.
